KATA PENGANTAR

Jadual Hayat Ringkas, Malaysia, 2020-2022 mengandungi jadual hayat ringkas mengikut kumpulan umur, kumpulan etnik dan jantina di peringkat Malaysia dan negeri. Jadual hayat ringkas ini dijana menggunakan statistik kematian pertengahan tahun dan anggaran penduduk pertengahan tahun. Statistik berkaitan jadual hayat ringkas yang diterbitkan dalam laporan ini adalah berdasarkan konsep dan garis panduan daripada *Model Life Tables for Developing Countries*, yang diterbitkan oleh *United Nations* (1982) dan *Modified Logit Life Table System: Principles, Empirical Validation and Application* yang diterbitkan oleh *World Health Organization* (2003).

Jangkaan hayat ketika lahir digunakan secara meluas untuk mengukur paras keseluruhan mortaliti penduduk manakala nisbah ketakatan diperlukan sebagai input utama dalam penyediaan unjuran penduduk. Statistik ini turut digunakan sebagai input utama dalam pembentukan, pelaksanaan dan pemantauan dasar di peringkat nasional dan antarabangsa terutamanya dalam bidang kependudukan, kesihatan dan ekonomi.

Penerbitan ini mengandungi lima bahagian utama. Bahagian pertama penerbitan ini membentangkan infografik dan ringkasan penemuan, manakala bahagian kedua memuatkan jadual ringkasan peringkat Malaysia. Bahagian ketiga dan keempat pula memuatkan jadual terperinci peringkat Malaysia dan negeri bagi membantu pengguna membuat analisis. Bahagian terakhir mengandungi nota teknikal yang menerangkan konsep, definisi dan metodologi bagi membantu pengguna memahami statistik yang diterbitkan.

Jabatan merakamkan setinggi-tinggi penghargaan kepada semua pihak yang telah menyumbang dalam penyediaan penerbitan ini. Setiap maklum balas dan cadangan daripada semua pihak untuk penambahbaikan penerbitan ini pada masa akan datang amat dihargai.

PREFACE

Abridged Life Tables, Malaysia, 2020-2022 contains abridged life tables by age group, ethnic group and sex at Malaysia and state. The abridged life tables are generated based on the mid-year deaths and mid-year population estimates. The statistics on abridged life tables published in this report adopted the concepts and guidelines from Model Life Tables for Developing Countries, published by United Nations (1982) and Modified Logit Life Table System: Principles, Empirical Validation and Application published by World Health Organization (2003).

Life expectancy at birth is used widely to measure the level of mortality of the population while the survival ratio is required as a key input in the preparation of population projections. These statistics are also used as inputs in the formulation, implementation and monitoring of policy at the national and international levels in the field of population, health and economy.

This publication consists of five main parts. The first part of this publication presents the infographic and summary of findings, while the second part presents a summary table at Malaysia level. The third and fourth parts include a detailed table at Malaysia and state to facilitate users in conducting analysis. The last part contains technical notes consisting of the concepts, definitions and methodology is also incorporated in this publication to assist users in understanding the published statistics.

The Department gratefully acknowledges the cooperation rendered by all parties who have contributed in preparing this publication. Every feedback and suggestion from all parties towards improving the future publication is highly appreciated.

RINGKASAN PENEMUAN

1. PENGENALAN

Jadual Hayat Ringkas, Malaysia, 2020-2022 membentangkan jadual hayat mengikut kumpulan umur, kumpulan etnik dan jantina di peringkat Malaysia dan negeri. Jadual hayat ringkas di peringkat Malaysia disediakan mengikut kumpulan umur, kumpulan etnik utama dan jantina manakala di peringkat negeri mengikut kumpulan umur dan jantina sahaja. Jadual hayat ini dijana menggunakan statistik kematian pertengahan tahun dan anggaran penduduk pertengahan tahun.

Jadual hayat ringkas bagi tahun 2020 (muktamad) dan 2021 (permulaan) dianggarkan menggunakan model *Coale-Demeny (West)* berasaskan kepada purata bilangan kematian pertengahan tahun untuk tempoh tiga tahun. Bagi jadual hayat ringkas tahun semasa, 2022 (anggaran), dijana menggunakan model *Brass Logit*.

Jadual hayat ringkas adalah jadual yang menunjukkan **kebarangkalian mati seseorang pada sesuatu umur (selang umur 5 tahun) sebelum mencapai ulang tahun kelahiran seterusnya**. Pengiraan jadual hayat disediakan menggunakan input kadar mortaliti umur tertentu atau kebarangkalian mati (q_x) dan hasilnya akan digunakan untuk mengukur mortaliti, nisbah ketakutan dan jangkaan hayat.

Jangkaan hayat adalah **purata baki umur (tahun) seseorang dijangka dapat hidup** pada permulaan umur tertentu dengan andaian kadar mortaliti umur tertentu adalah sama sepanjang hayat.

Human Development Index (HDI) merupakan indeks yang mengukur pencapaian purata dalam komposit utama pembangunan manusia: kehidupan yang sihat dan umur yang panjang, berpengetahuan dan mempunyai taraf hidup yang baik. *Human Development Report* telah dikeluarkan oleh *United Nations Development Programme (UNDP)* dan telah diterbitkan sejak 1990 hingga 2020.

Objektif utama HDI adalah untuk menyediakan indikator yang mudah untuk menilai kemajuan manusia dalam suatu negara berdasarkan kebebasan bagi menjalani kehidupan yang mereka inginkan. HDI menggunakan formula yang ringkas tetapi komprehensif bagi menilai purata jangka hayat, pendidikan dan pendapatan penduduk.

Berdasarkan Laporan HDI, 2020, 10 negara yang disenaraikan sebagai *Very High Human Development Index* iaitu Hong Kong, China (SAR) mencatatkan jangkaan hayat ketika lahir tertinggi iaitu 84.9 tahun manakala PNK per kapita tertinggi dicatatkan oleh Switzerland, \$69,394.

KESAN PANDEMIK COVID-19 TERHADAP JANGKAAN HAYAT

(Rosmiyawati Anwar, Mohamad Shukor Mat Lazim, Nur Azmina Mohd Zuhkhori, Amirul Hafiz Azelan)

PENGENALAN

Jangkaan hayat merupakan salah satu penunjuk status kesihatan penduduk di sesebuah negara. Jangkaan hayat ketika lahir juga dapat menggambarkan corak kematian yang berlaku di semua kumpulan umur sama ada kanak-kanak, orang dewasa dan orang tua. Walaupun indikator ini tidak menggambarkan realiti perjalanan hayat sebenar seseorang pada kohort umur tertentu serta tidak boleh ditafsirkan sebagai unjuran atau ramalan jangka hayat mana-mana individu, ianya dapat menjelaskan tentang corak kematian semasa di sesebuah negara. Namun begitu, jangkaan hayat turut dipengaruhi oleh beberapa faktor luar jangka seperti perperangan, bencana alam dan wabak.

Pandemik COVID-19 yang melanda dunia bagi tempoh 2020 menyebabkan penurunan jangkaan hayat seseorang di sesebuah negara. Ia merupakan jumlah terbesar semenjak Perang Dunia Kedua berlaku¹. Penurunan jangkaan hayat di kebanyakan negara adalah berbeza-beza dan ianya mempunyai kaitan dengan peningkatan jumlah kematian akibat COVID-19. Sejak tahun 1950, kemerosotan tahunan dalam jangkaan hayat hanya berlaku pada peristiwa yang jarang berlaku, seperti di Cambodia pada 1970-an, Rwanda pada 1990-an, dan beberapa negara Afrika sub-Sahara berikutan kemuncak wabak AIDS (Heuveline, 2022).

Pada akhir bulan Disember 2019, dunia digemparkan dengan kemunculan Koronavirus atau COVID-19. Virus yang berasal daripada wilayah Wuhan, China ini mudah berjangkit daripada seseorang yang bergejala (seperti demam, batuk dan sesak nafas) kepada seseorang yang lain melalui batuk atau bersin. Virus ini bukan sahaja mudah berjangkit, malah orang yang dijangkiti juga terdedah kepada risiko kematian memandangkan vaksin untuk merawatnya masih belum ditemui pada ketika itu.

Pertubuhan Kesihatan Dunia (WHO) mengisytiharkan virus ini sebagai pandemik pada 11 Mac 2020 (WHO, 2020²). Sehingga 28 Jun 2020, terdapat 216 buah negara, kawasan atau wilayah yang terlibat dengan penularan virus ini dengan angka mencecah 9,843,073 kes COVID-19 yang disahkan, termasuk 495,760 kematian yang dilaporkan (WHO, 2020³).

¹ <https://www.ox.ac.uk/news/>

² WHO timeline COVID-19

³ WHO Coronavirus Disease (COVID-19) Dashboard

Malaysia tidak terkecuali dalam penularan virus ini. Kes COVID-19 pertama di Malaysia dikesan pada 25 Januari 2020 (Kementerian Kesihatan Malaysia (KKM), 2020). Sehingga 28 Jun 2020, jumlah kes COVID-19 di negara ini telah meningkat sehingga 8,634, termasuk 121 kematian seperti yang dilaporkan oleh KKM (2020). Sehubungan itu, bagi membendung penularan kes COVID-19 di Malaysia, kerajaan telah menguatkuasakan Perintah Kawalan Pergerakan (PKP). Fasa PKP dan tempoh pelaksanaan PKP adalah seperti di Jadual 1.

Jadual 1: Fasa dan tempoh Perintah Kawalan Pergerakan

Fasa PKP	Tempoh
PKP 1.0	18 Mac-3 Mei 2020
PKP 2.0	13 Januari-18 Februari 2020 19 Februari-4 Mac 2021
PKP 3.0	1-14 Jun 2021

Sumber: Majlis Keselamatan Negara Malaysia (MKN)

Jangkaan hayat di peringkat dunia juga mencatatkan penurunan 0.92 tahun bagi tempoh 2019 dan 2020, manakala 0.72 tahun bagi tempoh 2020 dan 2021. Dapatkan dari artikel juga menunjukkan bahawa terdapat perubahan tahunan dalam jangkaan hayat negara Asia antaranya Philippines (Asia Tenggara) mencatatkan penurunan 3.0 tahun, India (Asia Selatan) 2.6 tahun, Asia Tengah iaitu Kazakhstan 3.2 tahun dan Lebanon (Asia Barat) 3.4 tahun. Selain itu, beberapa negara di benua Afrika seperti Tunisia, penurunan 3.4 tahun, South Africa (3.1 tahun) dan Egypt (2.3 tahun). (Heuveline, 2022)

Di samping itu juga, bilangan "lebihan kematian" iaitu perbezaan antara jumlah kematian sebenar dan jumlah kematian yang dijangka berlaku semasa ketidadaan pandemik (berdasarkan trend pra-pandemik) akan memberikan gambaran tentang kesan kematian akibat wabak pandemik COVID-19 (Helleringer dan Lanza Queiroz, 2021).

Selain itu, beberapa kajian terkini turut mengkaji kesan COVID-19 terhadap jangkaan hayat ketika lahir. Antaranya, Trias-Llimós dan Bilal yang mengkaji kesan krisis COVID-19 terhadap jangkaan hayat di bandar Madrid, yang merupakan bandar yang paling terjejas oleh penyakit tersebut di Sepanyol. Hasil daripada kajian tersebut berdasarkan data kematian bagi tempoh 9 Mac hingga 10 Mei 2020, menunjukkan bahawa terdapat pengurangan jangkaan hayat disebabkan COVID-19 iaitu 1.9 tahun untuk lelaki dan 1.6 tahun untuk perempuan (Trias-Llimós, S., Riffe, T., & Bilal, U. (2020)). Selain itu, Razeghi Nasrabad HB dan Sasanipour yang mengkaji kesan COVID-19 di Iran juga menunjukkan terdapat pengurangan jangkaan hayat ketika lahir 1.4 tahun pada 2020 (Razeghi Nasrabad, H. B., & Sasanipour, M. (2022)).

Kesan pandemik ini juga telah memberi impak yang besar kepada sistem kesihatan di kebanyakan negara, yang mana ianya berpotensi membawa kepada peningkatan

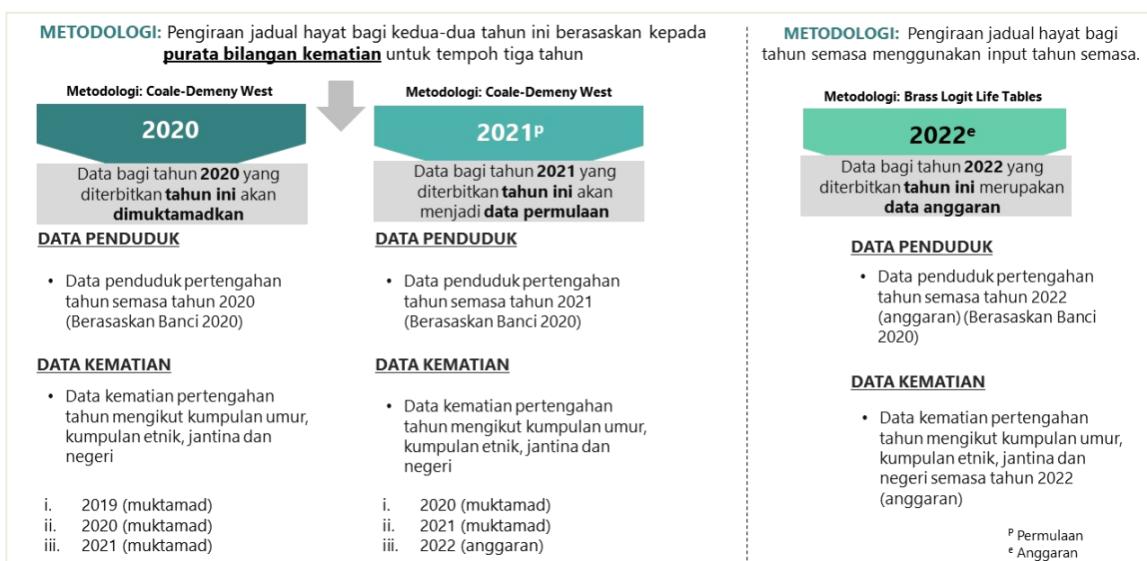

morbidity and mortality yang disebabkan kesan langsung akibat jangkitan COVID-19. Peningkatan bilangan kematian (lebihan kematian) ini, secara langsung dan tidak langsung akan menyebabkan penurunan dalam jangkaan hayat di sesebuah negara. Penurunan dalam jangkaan hayat boleh menyebabkan penurunan dalam profil kesihatan yang didorong oleh trend sosioekonomi yang buruk, pengurangan peruntukan atau kualiti penjagaan kesihatan atau faktor tingkah laku yang merosot (Ho dan Hendi, 2018).

Sehubungan itu, artikel ini akan membincangkan penemuan diskriptif berdasarkan perbandingan jangkaan hayat yang mengambil kira semua sebab kematian dan jangkaan hayat tanpa mengambil kira sebab kematian COVID-19 di Malaysia bagi tempoh 2020 hingga 2022.

METODOLOGI

Jadual hayat ringkas bagi tahun 2020 dan 2021 dijana menggunakan model *Coale-Demeny (West)* yang berasaskan kepada purata bilangan kematian pertengahan tahun untuk tempoh tiga tahun dan anggaran penduduk pertengahan tahun bagi tahun berkenaan berasaskan Banci Penduduk dan Perumahan Malaysia (Banci 2020). Jadual hayat ringkas bagi tahun 2022 pula dijana menggunakan model *Brass Logit* iaitu input kematian yang digunakan adalah merujuk kepada bilangan kematian pertengahan tahun dan penduduk adalah menggunakan anggaran penduduk pertengahan tahun bagi tahun 2022. Ringkasan metodologi pengiraan jadual hayat ringkas bagi tahun 2020 hingga 2022 adalah seperti di **Paparan 1**.

Paparan 1: Metodologi pengiraan jadual hayat ringkas, Malaysia, 2020-2022

Penjanaan jadual hayat ringkas adalah mengambil kira semua sebab kematian yang berlaku pada tempoh jadual hayat ringkas diterbitkan. Walau bagaimanapun, bagi menilai kesan COVID-19 terhadap jangkaan hayat di Malaysia sama ada terdapat peningkatan bilangan tahun atau sebaliknya, pengiraan jadual hayat ringkas dengan **tidak** mengambil

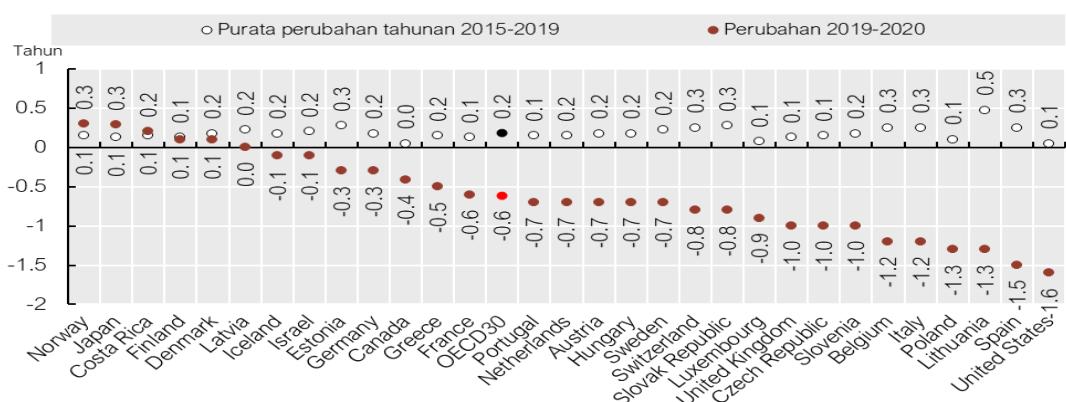

kira kematian disebabkan COVID-19 peringkat Malaysia bagi tempoh 2020 hingga 2022 telah dikira.

DAPATAN KAJIAN

Senario semasa jangkaan hayat negara lain

Pada 2020, terdapat penurunan jangkaan hayat bagi tempoh 2019 hingga 2020 di 24 buah negara daripada 30 buah negara OECD berbanding tempoh 2015 hingga 2019 (*Health at a Glance 2021: OECD Indicators*, 2021). Dalam kalangan 30 buah negara, enam negara yang tidak menunjukkan penurunan dalam jangkaan hayat akibat pandemik ini adalah Norway, Japan, Costa Rica, Finland, Denmark dan Latvia.

Paparan 2: Pengurangan jangkaan hayat ketika lahir ketika pandemik

Sumber: *Health at a Glance Report, 2021*

WHO menganggarkan jumlah kematian di peringkat dunia disebabkan COVID-19 adalah berjumlah sekurang-kurangnya tiga juta kematian. Peningkatan jumlah kematian (lebih kematian) pada tahun 2020 di 24 buah negara ini telah memberi implikasi kepada jangkaan hayat di negara tersebut. (*Health at a Glance 2021: OECD Indicators, 2021*)

Kajian lain juga menunjukkan bahawa epidemik coronavirus ini telah menyebabkan penurunan jangkaan hayat turut berlaku di beberapa negara lain antaranya Singapore (0.2 tahun pada 2021 berbanding 2019), Brazil (1.3 tahun pada 2020) dan Iran (1.4 tahun pada 2020). Situasi penurunan jangkaan hayat juga berlaku di Malaysia bermula pada 2020 hingga 2022.

Kematian COVID-19 di Malaysia bagi tempoh 2020 hingga 2022

Berdasarkan statistik kematian COVID-19 oleh KKM sehingga Ogos 2022 terdapat peningkatan kematian disebabkan COVID-19 bagi tempoh Januari hingga Disember 2021 berbanding pada 2020. Bilangan kematian disebabkan COVID-19 yang dicatatkan pada tahun 2021 meningkat kepada 31,063 kematian berbanding 516 kematian pada 2020. Walau bagaimanapun, sehingga Ogos 2022 bilangan kematian disebabkan COVID-19 mulai menunjukkan penurunan kepada 4,646 kematian.

Namun begitu, bagi tujuan analisis dalam artikel ini, bilangan kematian tahunan disebabkan COVID-19 telah disusun semula mengikut pertengahan tahun seperti Jadual 3 supaya selari dengan metodologi pengiraan jadual hayat ringkas yang dikeluarkan.

Bilangan kematian COVID-19 pertengahan tahun mencatatkan peningkatan kepada 30,045 kematian pada 2022 berbanding 121 kematian pada 2020 dan 5,616 kematian pada 2021. Bagi melihat sama ada penurunan ini disumbangkan oleh kematian disebabkan COVID-19, penjanaan jadual hayat ringkas **tanpa mengambil kira sebab kematian COVID-19** telah disediakan. Input bagi tahun 2020, 2021 dan 2022 adalah tidak termasuk sebab kematian COVID-19.

Jangkaan hayat tanpa mengambil kira sebab kematian COVID-19

Pada 2020, seorang bayi yang lahir secara purata dijangka hidup 0.1 tahun lebih lama iaitu mencapai 74.8 tahun berbanding 74.7 tahun. Secara purata, seorang bayi lelaki yang lahir pada 2020 dijangka boleh hidup lebih lama sehingga 72.6 tahun manakala bayi perempuan dijangka boleh hidup sehingga 77.3 tahun, meningkat 0.1 tahun. [Carta 5]

Lelaki dan perempuan yang mencapai umur 15 tahun pada 2020 masing-masing dijangka hidup selama 58.4 tahun dan 63.0 tahun lagi. Dengan tidak mengambil kira sebab kematian COVID-19, jangkaan hayat bagi lelaki dan perempuan masing-masing meningkat 0.1 tahun. Ini bermakna, lelaki pada umur 15 tahun dijangka hidup sehingga 73.4 tahun dan perempuan sehingga umur 78.0 tahun. [Carta 6]

Lelaki dan perempuan yang berumur 60 tahun pada 2020 masing-masing dijangka hidup selama 18.2 tahun dan 20.9 tahun lagi. Jangkaan hayat pada umur 60 tahun tidak menunjukkan perubahan sama ada dengan mengambil kira sebab kematian COVID-19 atau sebaliknya. [Carta 7]

RUMUSAN

Kajian ini memberikan penilaian awalan mengenai kesan pandemik COVID-19 terhadap jangkaan hayat dengan membandingkan senario kematian semua sebab dan tanpa mengambil kira sebab kematian COVID-19 di peringkat Malaysia. Dapatan menunjukkan sekiranya tiada kematian disebabkan COVID-19 berlaku bagi tempoh 2020 hingga 2022, seseorang dijangka hidup lebih lama. Dapatan ini adalah selari dengan kajian yang dilakukan oleh negara lain seperti di Iran, Brazil dan United States. Bagi kes di Malaysia, pengurangan jangkaan hayat turut dipengaruhi oleh faktor lebihan kematian (*excess deaths*) yang berlaku semasa pandemik COVID-19 pada tempoh yang sama. Oleh yang demikian, kajian yang khusus mengenai lebihan kematian boleh dilaksanakan bagi melihat trend lebihan kematian yang berlaku semasa pandemik dengan lebih lanjut.

1. INTRODUCTION

The Abridged Life Tables, Malaysia, 2020-2022 presents life tables by age group, ethnic group and sex in Malaysia and state. The abridged life tables for Malaysia are presented by age group, major ethnic group and sex, whereas for state by age group and sex only. These life tables are generated based on the mid-year deaths and mid-year population estimates.

The abridged life tables for 2020 (final) and 2021 (preliminary) are estimated using the Coale-Demeny (West) model based on the average number of mid-year deaths for three years. For the current year, 2022 (estimate), the Brass Logit model was used.

Abridged life table is a table that shows **the probability that a person at a certain age (5-year age interval) will die before reaching his or her next birthday**. The calculation of life table is prepared using inputs of age-specific mortality rates or probability of deaths (q_x) and the results used to measure mortality, survival ratio and life expectancy.

Life expectancy is the **average remaining age (years) for a person is expected to live** at the beginning of a certain age, assuming the mortality rate of a certain age is the same throughout his or her lifetime.

3. LIFE EXPECTANCY AT BIRTH

Life Expectancy at Birth Decreased for the Period of 2020-2022

Baby born in 2020, 2021 and 2022 on average is expected to live until 74.7 years, 74.5 years and 73.4 years respectively.

For the period of 2012 to 2019 (7 years), life expectancy at birth increased by 0.4 years with males increased by 0.3 years and females, 0.5 years. However, from 2020 to 2022 (3 years), life expectancy at birth decreased by 1.3 years with males decreased by 1.2 years while females decreased by 1.4 years.

The decline in life expectancy for 2020 to 2022 is attributed to the increase in the number of excess deaths during pandemic COVID-19 in 2021. Similar impact will be seen for age specific analysis of life expectancy.

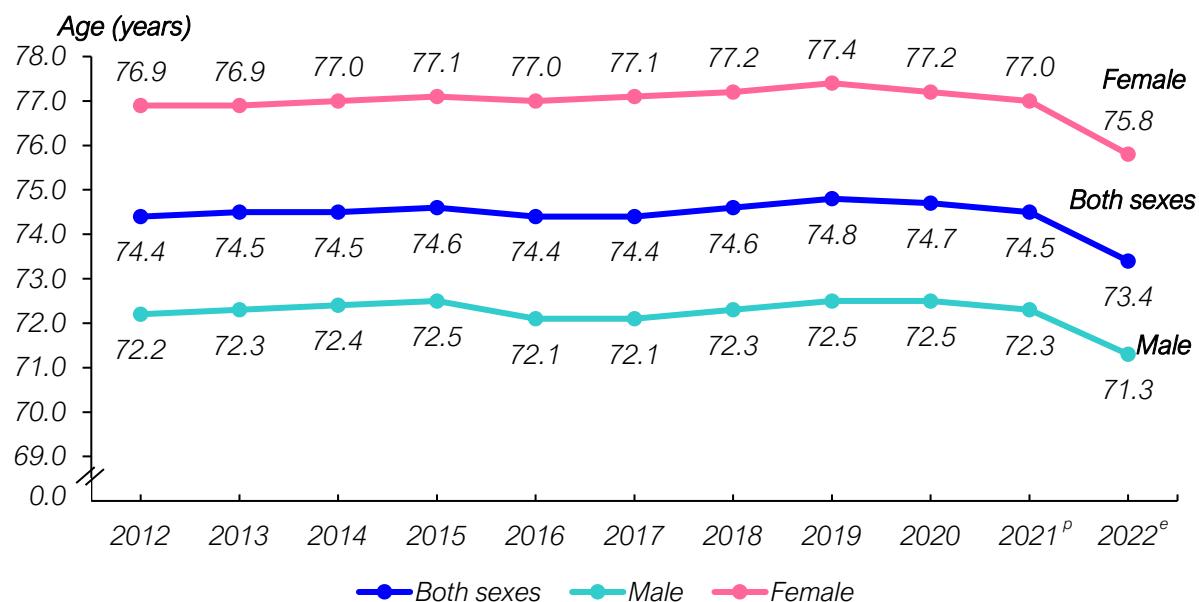

Chart 1: Change in life expectancy at birth, Malaysia, 2012-2019 and 2020-2022

A baby girl born in 2020 and 2021 is expected to live up to 77.2 years and 77.0 years respectively, while a baby boy is expected to live up to 72.5 years and 72.3 years respectively for the same period.

On average, a baby girl born in 2022 is expected to live until 75.8 years while a baby boy is expected to live until 71.3 years. [Chart 2]

Chart 2: Life expectancy at birth, Malaysia, 2012-2022

**Notes:**^p Preliminary^e Estimates

4. LIFE EXPECTANCY AT THE AGE OF 15 YEARS

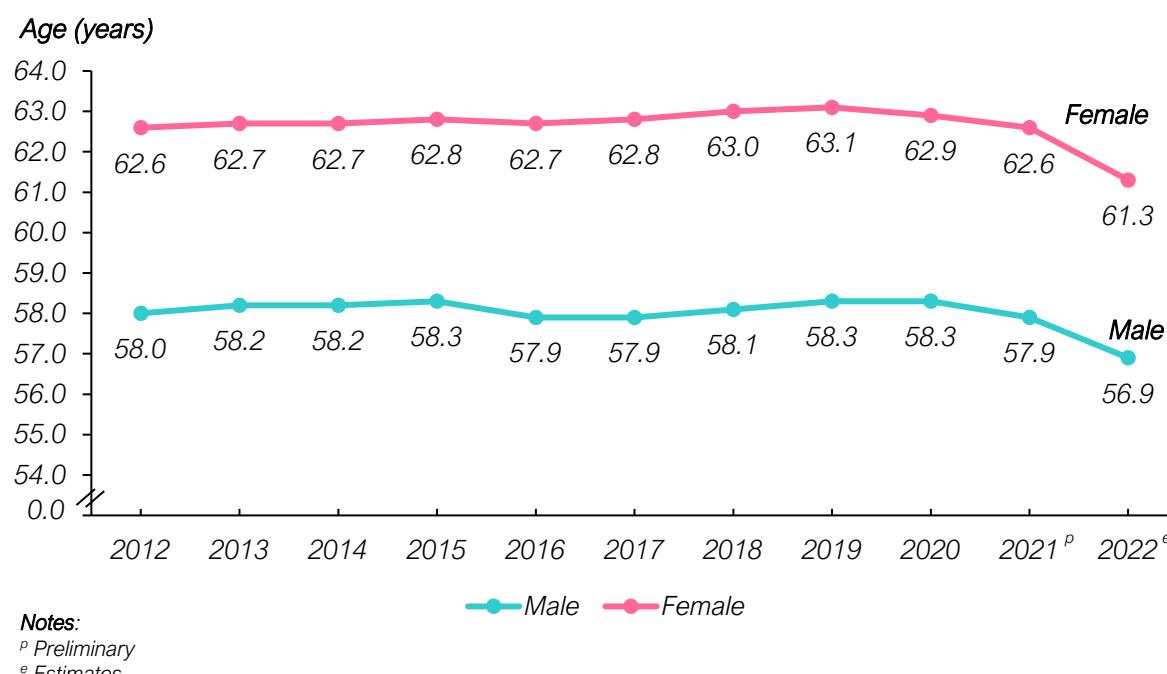

Females at the Age of 15 Years is Expected to Live 4 Years Longer for the Period 2020 to 2022

Males who reach the age of **15 years** in 2020, 2021 and 2022 are expected to live for another **58.3 years**, **57.9 years** and **56.9 years** respectively. This indicates that a male who reaches the age of 15 years old in 2020 is expected to live until the age of 73.3 years; a male who is 15 years old in 2021 is expected to live until the age of 72.9 years and a male who is 15 years old in 2022 is expected to live until the age of 71.9 years.

Females who reach the age of **15 years** in 2020, 2021 and 2022 are expected to live for another **62.9 years**, **62.6 years** and **61.3 years** respectively. Thus, a female who is 15 years old in 2020 is expected to live until 77.9 years; a female who is 15 years old in 2021 is expected to live until 77.6 years and a female who is 15 years old in 2022 is expected to live until the age of 76.3 years.

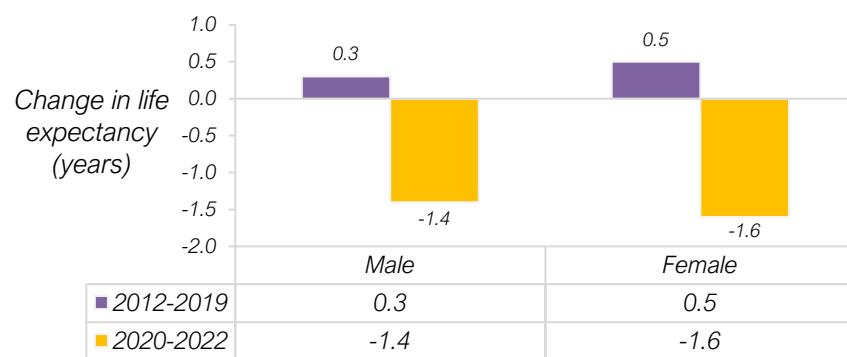

In terms of life expectancy, females outlived males by 4.6 years (2020), 4.7 years (2021) and 4.4 years (2022). [Chart 3]

Males and females who reach the age of 60 years in 2020 are expected to live for another 18.2 and 20.9 years, respectively. Thus, males aged 60 years in 2020 are expected to live until the age of 78.2 years and females, 80.9 years.

Males who are 60 years in 2021 are expected to live for another 18.0 years and females, 20.8 years. This implies, males aged 60 years in 2021 are expected to live until the age of 78.0 years and females, 80.8 years.

Males and females aged 60 years old in 2022 are expected to live for another 17.5 years and 20.1 years, respectively. These indicate males aged 60 years in 2022 are expected to live up to 77.5 years and females, 80.1 years.

Malaysia, 2012-2019 and 2020-2022**

The decrease in life expectancy for three years (2020-2022) is attributed to the increase in the number of excess deaths during the pandemic COVID-19 in 2021. Based on statistics of COVID-19 deaths in 2021 by the Ministry of Health, Malaysia (MoH), the age group of 60 to 64 years recorded the highest number of deaths, with 3,709 deaths as compared to 86 deaths in 2020.

Ngangue & Manfred (2015) study on the impact of life expectancy on the growth of Gross National Income (GNI) per capita for 141 developing countries during 2000-2013 showed that the improvement in life expectancy has a positive impact on economic growth.

In 2021, five (5) states recorded the highest life expectancy at birth surpassing the national level (74.5 years) namely Selangor (77.0 years), W.P. Kuala Lumpur (75.7 years), W.P. Putrajaya (74.9 years) and Sarawak & W.P. Labuan 74.8 years, respectively.

11. LIFE EXPECTANCY AT BIRTH AND GROSS NATIONAL INCOME (GNI) PER CAPITA FOR SELECTED COUNTRIES

The Human Development Index (HDI) is an index that measures of average achievement in key dimensions of human development: a long and healthy life, being knowledgeable and having a decent standard of living. Human Development Report was released by United Nations Development Programme (UNDP) and have been published since 1990 until 2020.

The main objective of HDI is to provide a simple measure of human progress – built around people's freedom to live the lives they prefer. The HDI has gained popularity with its simple but comprehensive formula that assesses a population's average longevity, education and income.

Based on the HDI report, 2020, 10 countries were listed as Very High Human Development Index namely Hong Kong, China (SAR) recorded the highest life expectancy at birth with 84.9 years while Switzerland has the highest GNI per capita with \$69,394.

EFFECTS OF COVID-19 PANDEMIC ON LIFE EXPECTANCY

(Rosmiyawati Anwar, Mohamad Shukor Mat Lazim, Nur Azmina Mohd Zuhkhori, Amirul Hafiz Azelan)

INTRODUCTION

Life expectancy is one of the indicators of the health status of the population in a country. Life expectancy at birth can also reflect the pattern of mortality that occurs in all age groups whether it is children, adults or older people. Although this indicator does not reflect the reality of a person's life journey in an age cohort and should not be interpreted as a projection or prediction of the life expectancy of any individual, it can explain the current pattern of death in a country. However, life expectancy is also affected by several extraneous factors such as wars, natural disasters and epidemics.

The COVID-19 pandemic that hit the world in 2020 has led to a decline in life expectancy in a country. It is the largest number since the Second World War¹. The decline in life expectancy in countries is different and has been attributed to the increase in the number of deaths due to COVID-19. Since 1950, annual declines in life expectancy have only been observed on rare occasions, such as in Cambodia in the 1970s, Rwanda in the 1990s, and some sub-Saharan African nations at the peak of the AIDS pandemic (Heuveline, 2022).

At the end of December 2019, an outbreak of respiratory disease associated with a new Coronavirus or COVID-19. The virus was reported in Wuhan, China easily spreads from a person with symptoms (such as fever, cough and difficulty breathing) to someone else through coughing or sneezing. The virus is not only contagious, but infected people are also at risk of death because a vaccine has not yet been discovered.

The World Health Organization (WHO) declared the virus a worldwide disease on 11 March 2020 (WHO, 2020²). As of June 28, 2020, there were 216 countries, regions or territories affected by the virus with a total of 9,843,073 confirmed COVID-19 cases, including 495,760 reported deaths (WHO, 2020³).

Malaysia is no exception to the spread of this disease. The first COVID-19 case in Malaysia was reported on January 25, 2020 (Ministry of Health Malaysia (MoH), 2020). As of June 28, 2020, the number of COVID-19 cases in Malaysia has increased to 8,634, including 121 deaths as reported by MoH (2020). Hence, to curb the spread of

COVID-19 cases in Malaysia, the government has enforced the Movement Control Order (MCO). MCO phase and period of the MCO showed in *Table 1*.

Global life expectancy appears to have declined by 0.92 years between 2019 and 2020, while 0.72 years for the period 2020 to 2021. The findings also showed that there is an annual change in the life expectancy throughout Asia including the Philippines (Southeast Asia) that recorded a decrease of 3.0 years, India (South Asia) 2.6 years, Central Asia namely Kazakhstan, 3.2 years and Lebanon (West Asia) 3.4 years. In addition, some countries in the continental African continent such as Tunisia, registered a decline of 3.4 years, South Africa (3.1 years) and Egypt (2.3 years). (Heuveline, 2022)

In addition, the number of "excess deaths" which is the difference between the actual number of deaths and the number of deaths expected to have occurred during the absence of the pandemic (based on pre-pandemic trends) will provide a fuller account of the mortality impact of the pandemic (Helleringer and Lanza Queiroz, 2021).

Some recent studies have examined the effect of COVID-19 on life expectancy at birth. Trias-Llimós and Bilal studied the role of the COVID-19 crisis on life expectancy in the city of Madrid, which was the city most affected by the disease in Spain. The results from the study, based on mortality data from March 9 to May 10, 2020, showed a reduction in life expectancy due to COVID-19 of 1.9 years for males and 1.6 years for females (Trias-Llimós, S., Riffe, T., & Bilal, U. (2020)). In addition, Razeghi Nasrabad HB and Sasanipour who studied the impact of COVID-19 in Iran also showed that there was a reduction in life expectancy at birth by 1.4 years in 2020 (Razeghi Nasrabad, H. B., & Sasanipour, M. (2022)).

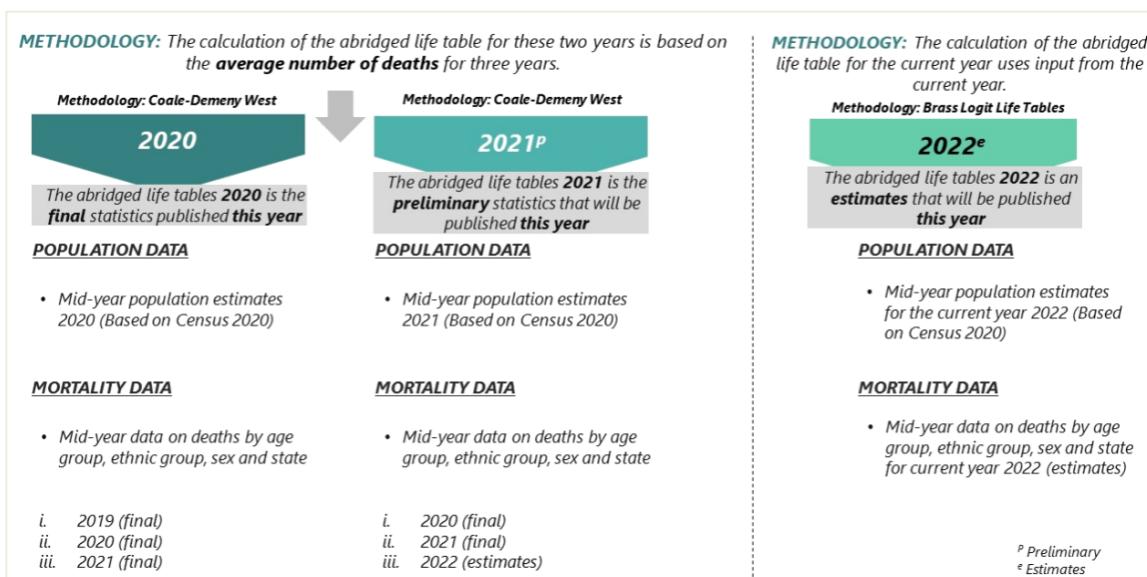

The pandemic has also had a significant impact on health systems in most countries, potentially leading to increased morbidity and mortality beyond the direct impact of COVID-19 infection. The increase in deaths (excess deaths), directly and indirectly, has the potential to lead to a decrease in life expectancy in a country. Stagnation or a decline in life expectancy can signal a decline in health profiles driven by adverse socioeconomic trends, decreased provision or quality of health care or deteriorating behavioral factors (Ho and Hendi, 2018).

This article will discuss the descriptive findings based on the comparison of life expectancy with all causes of death and life expectancy excluding the causes of death due to COVID-19 in Malaysia for the period 2020 to 2022.

METHODOLOGY

The abridged life table for 2020 and 2021 is generated using the Coale-Demeny (West) model based on the average number of mid-year deaths for the last three years and mid-year population estimates for the relevant year based on the Population and Housing Census of Malaysia (MyCensus 2020). The abridged life table for 2022 is generated using the Brass Logit model whereby the input of deaths is based on the mid-year deaths and the population is using the mid-year population estimates for 2022. Summary of the methodology for calculating the abridged life table for the years 2020 to 2022 as shown in Exhibit 1.

Exhibit 1: Methodology of the abridged life tables calculation, Malaysia, 2020-2022

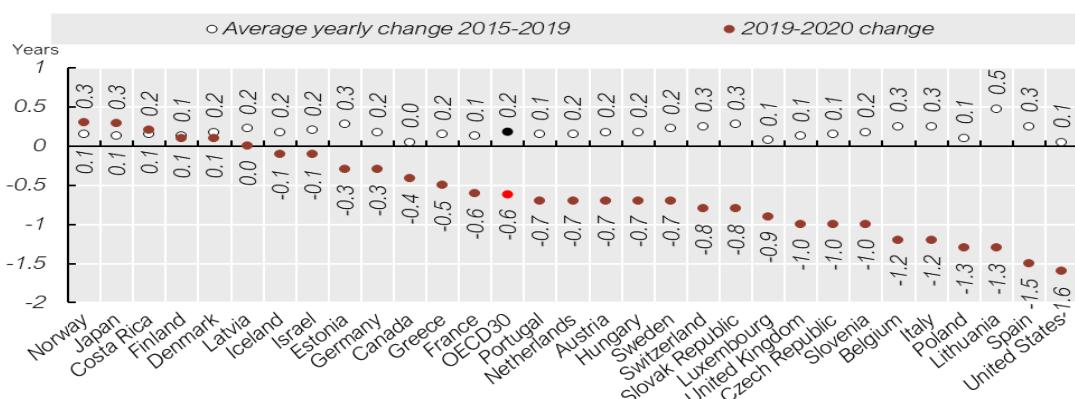

The calculation of abridged life tables considers all causes of death that occurred for the period. However, to assess the impact of COVID-19 on life expectancy in Malaysia whether there is an increase in the number of years or vice versa, a calculation of the abridged life table **excluding** causes of death due to COVID-19 at Malaysia level for the period 2020 to 2022 was calculated.

FINDINGS

The current scenario of other countries' life expectancy

In 2020, life expectancy dropped from the period 2019 to 2020 in 24 out of 30 OECD countries as compared to the period of 2015 to 2019 (Health at a Glance 2021: OECD Indicators, 2021). Among the 30 countries, six countries namely Norway, Japan, Costa Rica, Finland, Denmark and Latvia showed no decline in life expectancy.

Exhibit 2: Reductions in life expectancy at birth during the pandemic

Source: Health at a Glance Report, 2021

WHO estimated that the total global excess deaths attributable to COVID-19 in 2020, both directly and indirectly, should amount to at least three million. The exceptionally high number of deaths (excess deaths) in 2020 in these 24 countries had an impact on life expectancy in those countries. (Health at a Glance 2021: OECD Indicators, 2021)

Other studies also showed that the coronavirus epidemic has reduced life expectancy in other countries such as Singapore (0.2 years in 2021 as compared to 2019), Brazil (1.3 years in 2020) and Iran (1.4 years in 2020). This situation also occurred in Malaysia from 2020 to 2022.

COVID-19 Deaths in Malaysia for the period 2020 to 2022

Based on the statistics of COVID-19 deaths by the MoH until August 2022, there was an increase in deaths due to COVID-19 for the period January to December 2021 as compared to 2020. The number of deaths due to COVID-19 recorded in 2021 increased to 31,063 deaths as compared to 516 deaths in 2020. However, as at August 2022, the number of deaths due to COVID-19 has decreased to 4,646. [Table 2]

Nevertheless, for analysis in this article, the annual number of deaths due to COVID-19 has been recompiled to the mid-year as shown in Table 3 in line with the methodology of calculating the abridged life tables.

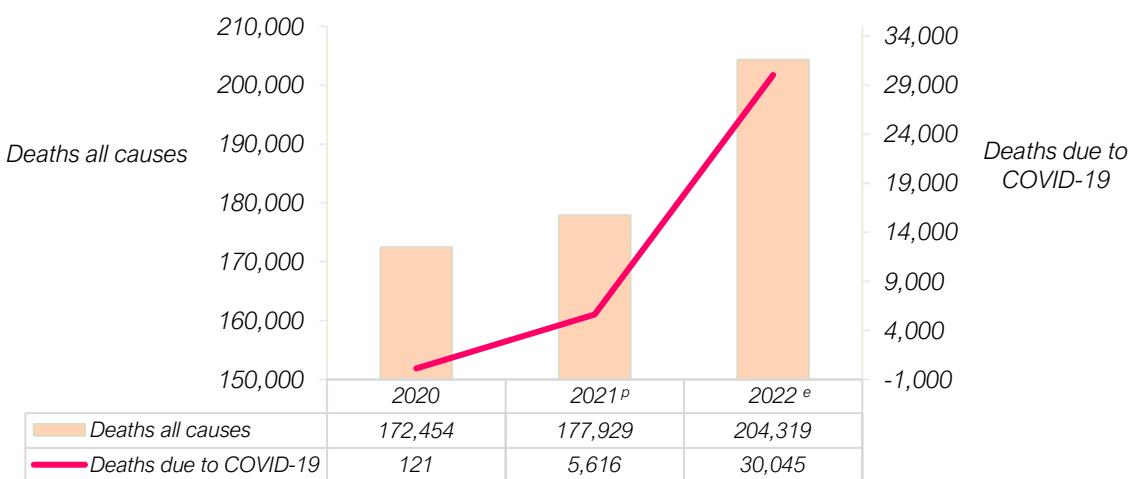

The number of mid-year deaths due to COVID-19 increased to 30,045 in 2022 deaths as compared to 121 deaths in 2020 and 5,616 deaths in 2021. The number of deaths due to COVID-19 by sex showed that males outnumbered females. The number of deaths for males due to COVID-19 in 2020 was 88 (72.7%), 3,353 deaths (59.7%) in 2021 and 17,124 deaths (57.0%) in 2022. Meanwhile, females' deaths due to COVID-19 were 33 deaths in 2020 (27.3%), 2,263 deaths (40.3%) in 2021 and 12,921 deaths (43%) in 2022. [Table 3]

The prevalence rate of COVID-19 in 2020 was 1.40 per cent and decreased to 0.76 per cent (2021) and recorded an increase of 0.03 percentage points in 2022. At a 10 per cent of COVID-19 prevalence rate, the loss in life expectancy at birth is estimated to be more than one year for North America and Europe and in Latin America and the Caribbean. This simulation has been carried out in four regions: North America and Europe; Latin America and the Caribbean; Southeast Asia and sub-Saharan Africa (Marois et al., 2020).

Comparison of life expectancy between all causes of death and excluding the causes of death due to COVID-19 for the period 2020-2022

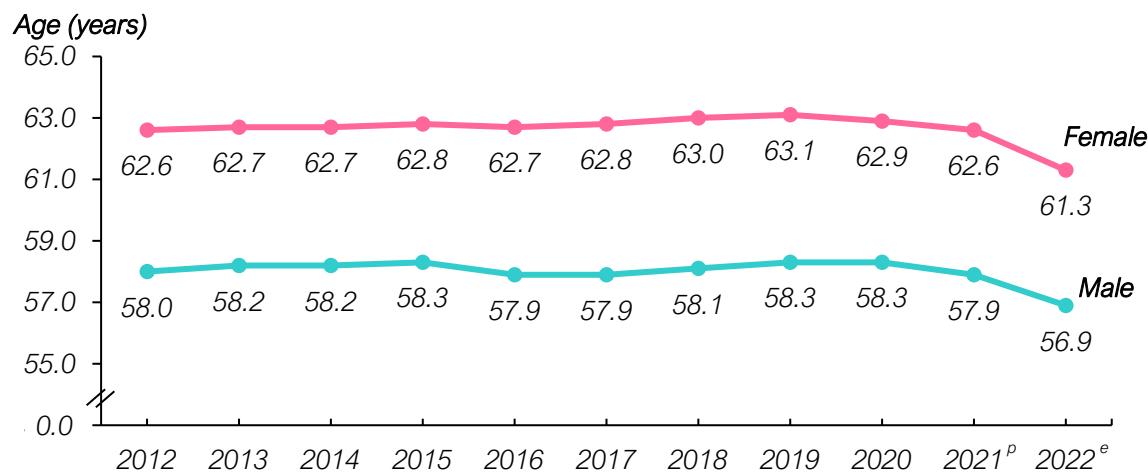

Findings of life expectancy with all causes of death showed a baby born in 2020 on average is expected to live up to 74.7 years, 74.5 years in 2021 and 73.4 years in 2022.

A baby girl born in 2020 and 2021 on average is expected to live up to 77.2 years and 77.0 years respectively, while a baby boy is expected to live up to 72.5 years and 72.3 years respectively for the same period. On average, a baby girl born in 2022 is expected to live until 75.8 years while a baby boy is expected to live until 71.3 years.

The result of life expectancy with ***all causes of death*** showed males who reach the age of 60 years in 2020, 2021 and 2022 are expected to live for another 18.2 years, 18.0 years and 17.5 years respectively. Females who reach the age of 60 years in 2020, 2021 and 2022 are expected to live for another 20.9 years, 20.8 years and 20.1 years respectively.

Chart 4: Life expectancy at the age of 60 years by sex (all causes of death), Malaysia, 2012-2022

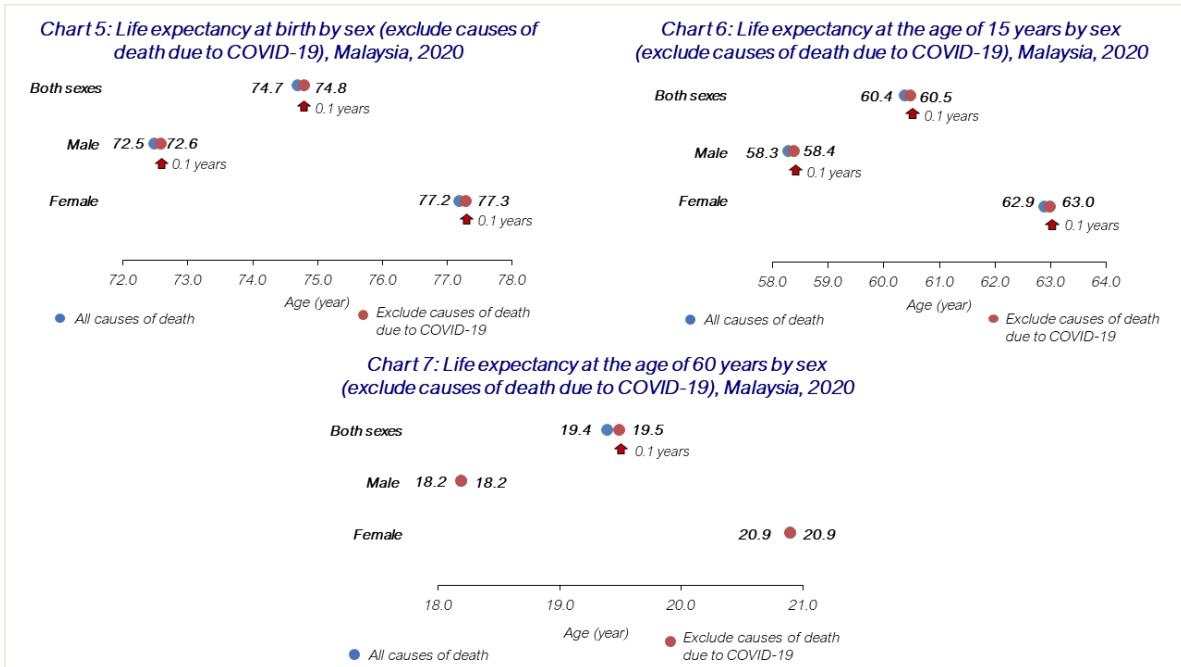

To determine whether this decline was contributed by deaths caused by COVID-19, the calculation of the abridged life table that ***excludes number of deaths due to COVID-19*** has been calculated. The inputs for 2020, 2021 and 2022 excluded the number of deaths due to COVID-19.

Life expectancy exclude causes of death due to COVID-19

A baby born in 2020 on average is expected to live 0.1 year longer to 74.8 years as compared to 74.7 years. On average, a baby boy born in 2020 is expected to live longer up to 72.6 years while a baby girl is expected to live up to 77.3 years, an increase by 0.1 year. [Chart 5]

Males and females who reach the age of 15 years in 2020, are expected to live for another 58.4 years and 63.0 years, respectively. Without considering COVID-19 in the calculation of life expectancy, life expectancy for males and females increased by 0.1 year respectively. These indicate that males reach at the age of 15 years were expected to live up to 73.4 years and females up to 78.0 years. [Chart 6]

Males and females who reach the age of 60 years in 2020 are expected to live for another 18.2 years and 20.9 years respectively. The life expectancy at the age of 60 years remained unchanged either including the causes of death of COVID-19 or vice versa. [Chart 7]

CONCLUSION

This study provides first assessments of the potential impact of COVID-19 on life expectancy by comparing the scenarios of life expectancy with all causes of death and life expectancy excluding death due to COVID-19 at Malaysia level. The results showed if no deaths due to COVID-19 occur for the period 2020 to 2022, a person is expected to live longer. These findings are in line with other studies in countries such as Iran, Brazil and the United States. For the case of Malaysia, the loss of life expectancy can be attributed to excess deaths that occurred due to COVID-19 during the same period. It would be fruitful to pursue further research about excess deaths in order to observe mortality during the pandemic.

1. PENGENALAN

- 1.1 Jadual hayat adalah satu cara untuk menggambarkan situasi mortaliti penduduk. Jadual hayat disediakan dengan menggunakan kadar mortaliti umur tertentu atau kebarangkalian mati (q_x) dan hasilnya digunakan untuk mengukur mortaliti, nisbah ketakatan dan jangkaan hayat.
- 1.2 Jangkaan hayat adalah purata baki umur (tahun) seseorang dijangka dapat hidup pada permulaan umur tertentu dengan andaian kadar mortaliti umur tertentu adalah sama sepanjang hayat. Jangkaan hayat ketika lahir adalah refleksi mortaliti dan bebas daripada struktur umur penduduk serta tidak dipengaruhi oleh faktor-faktor luar seperti pemilihan penduduk piawai, perubahan pada kadar kelahiran dan lain-lain fenomena demografi.
- 1.3 Jadual hayat digunakan oleh ahli demografi, pekerja kesihatan awam dan aktuari dalam kajian kesuburan, mortaliti, migrasi, kepanjangan usia, pertumbuhan penduduk, unjuran penduduk, tempoh hayat bekerja dan tempoh hayat berkahwin¹.
- 1.4 Penerbitan ini juga menyediakan jadual hayat mengikut pengelasan kumpulan etnik utama di peringkat Malaysia berdasarkan klasifikasi yang telah diguna pakai semasa Banci Penduduk dan Perumahan Malaysia 2020 (Banci 2020). Klasifikasi tersebut adalah:

Warganegara

- a. Bumiputera terdiri daripada Melayu dan Bumiputera lain
- b. Cina
- c. India
- d. Lain-lain

Bukan Warganegara

- 1.5 Statistik jangkaan hayat bagi tahun 2020 hingga 2022 telah disemak semula berasaskan Banci 2020 manakala statistik jangkaan hayat bagi tahun 2010 hingga 2019 adalah berasaskan Banci Penduduk dan Perumahan Malaysia 2010 (Banci 2010) dan akan disemak semula.

2. KONSEP

- 2.1 Jadual hayat ringkas adalah jadual yang menunjukkan kebarangkalian mati seseorang pada sesuatu umur (selang umur 5 tahun) sebelum mencapai ulang tahun kelahiran seterusnya. Jadual hayat disediakan menggunakan kadar mortaliti umur tertentu atau kebarangkalian mati (q_x) dan hasilnya digunakan untuk mengukur mortaliti, nisbah ketakatan dan jangkaan hayat.
- 2.2 Jangkaan hayat adalah purata baki umur (tahun) seseorang dijangka dapat hidup pada permulaan umur tertentu dengan andaian kadar kematian umur tertentu adalah sama sepanjang hayat.
- 2.3 Penakat ialah bilangan orang yang masih hidup pada permulaan umur tertentu.

3. METODOLOGI

- 3.1 Jadual hayat ringkas dijana menggunakan model *Coale-Demeny (West)* yang berasaskan kepada purata bilangan kematian pertengahan tahun untuk tempoh tiga tahun. Pendekatan ini telah digunakan untuk meminimumkan turun naik bilangan kejadian penting tahunan secara rawak. Penggunaan data kematian untuk tempoh tiga tahun ini bermakna akan sentiasa berlaku ketinggalan masa satu atau dua tahun sebelum jadual hayat untuk tahun terkini dapat disediakan. Oleh itu, bagi memenuhi permintaan daripada pengguna, model *Brass Logit*² digunakan bagi menjana anggaran jadual hayat terkini.
- 3.2 Jadual hayat ringkas 2020 (muktamad) dijana menggunakan model *Coale-Demeny (West)* yang berasaskan purata bilangan kematian pertengahan tahun mengikut kumpulan umur, kumpulan etnik, jantina dan negeri bagi tahun 2019, 2020 dan 2021 yang telah dimuktamadkan.
 - 3.2.1 Data kematian pertengahan tahun 2019 merujuk kepada kematian yang direkodkan pada separuh tahun (*half-yearly*) kedua 2018 bermula Julai hingga Disember 2018 dan kematian separuh tahun pertama 2019 bermula Januari hingga Jun 2019 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
 - 3.2.2 Data kematian pertengahan tahun 2020 merujuk kepada kematian yang direkodkan pada separuh tahun kedua 2019 bermula Julai hingga Disember 2019 dan kematian separuh tahun pertama 2020 bermula

² W. Brass (1975)

- Januari hingga Jun 2020 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
- 3.2.3 Data kematian pertengahan tahun 2021 merujuk kepada kematian yang direkodkan pada separuh tahun kedua 2020 bermula Julai hingga Disember 2020 dan kematian separuh tahun pertama 2021 bermula Januari hingga Jun 2021 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
- 3.2.4 Input penduduk yang digunakan bagi penjanaan jadual hayat ringkas 2020 ini adalah data anggaran penduduk pertengahan tahun 2020 berdasarkan Banci 2020 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
- 3.3 Jadual hayat ringkas 2021 (permulaan) dijana menggunakan model *Coale-Demeny (West)* yang berdasarkan purata bilangan kematian pertengahan tahun mengikut kumpulan umur, kumpulan etnik, jantina dan negeri bagi tahun 2020, 2021 dan 2022 (anggaran).
- 3.3.1 Data kematian pertengahan tahun 2020 merujuk kepada kematian yang direkodkan pada separuh tahun kedua 2019 bermula Julai hingga Disember 2019 dan kematian separuh tahun pertama 2020 bermula Januari hingga Jun 2020 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
- 3.3.2 Data kematian pertengahan tahun 2021 merujuk kepada kematian yang direkodkan pada separuh tahun kedua 2020 bermula Julai hingga Disember 2020 dan kematian separuh tahun pertama 2021 bermula Januari hingga Jun 2021 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
- 3.3.3 Anggaran data kematian pertengahan tahun 2022 merujuk kepada kematian yang direkodkan pada separuh tahun kedua 2021 bermula Julai hingga Disember 2021 dan kematian separuh tahun pertama 2022 bermula Januari hingga Jun 2022 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri. Anggaran kematian 2022 adalah berdasarkan data siri masa kematian 10 tahun menggunakan kaedah *time series modeller-exponential smoothing models*.
- 3.3.4 Input penduduk yang digunakan bagi penjanaan jadual hayat ringkas 2021 adalah data anggaran penduduk pertengahan tahun 2021 berdasarkan Banci 2020 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.

- 3.4 Jadual hayat ringkas 2022 (anggaran) dijana menggunakan model *Brass Logit* berasaskan input anggaran data kematian pertengahan tahun dan anggaran penduduk pertengahan tahun pada tahun semasa.
- 3.4.1 Anggaran data kematian pertengahan tahun 2022 merujuk kepada kematian yang direkodkan pada separuh tahun kedua 2021 bermula Julai hingga Disember 2021 dan kematian separuh tahun pertama 2022 bermula Januari hingga Jun 2022 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
- 3.4.2 Input penduduk yang digunakan bagi penjanaan jadual hayat ringkas 2022 adalah data anggaran penduduk pertengahan tahun 2022 berasaskan Banci 2020 mengikut umur satu tahunan, kumpulan etnik, jantina dan negeri.
- 3.5 Pengiraan jadual hayat memerlukan satu set nilai input sama ada kadar mortaliti umur tertentu bagi penduduk, ${}_nM_x$ atau nilai ${}_nq_x$ iaitu kebarangkalian mati di antara umur tepat x dan umur tepat $x + n$, di mana n bersamaan selang umur 5 tahun kecuali dua kumpulan umur iaitu di bawah 1 tahun dan 1-4 tahun.
- 3.6 Untuk menganggarkan ${}_1q_0$ dan ${}_4q_1$ daripada ${}_1M_0$ dan ${}_4M_1$ dan ${}_1L_0$ (di mana ${}_1L_0$ merujuk kepada bilangan orang hidup-tahun di antara umur 0 dan 1) dan ${}_4L_1$ daripada ${}_1q_0$ dan ${}_4q_1$, faktor-faktor pemisah kematian yang diperlukan adalah daripada jadual hayat model *Coale-Demeny*³.
- 3.7 Data input adalah dalam bentuk 17 nilai ${}_nM_x$ atau ${}_nq_x$. Jika terdapat lebih daripada 17 nilai, hanya data sehingga ${}_5q_{75}$ akan diambil. Jika ia kurang daripada 17 nilai, iaitu, data bagi kumpulan umur bawah 75 tahun, ekstrapolasi akan dibuat sehingga umur 75 tahun.
- 3.8 Ekstrapolasi ini dibuat dengan andaian bahawa nilai ${}_5q_x$ mempunyai fungsi eksponen. Nisbah dua nilai ${}_nq_x$ yang tertinggi dalam data input telah dijadikan pemalar untuk menganggarkan nilai ${}_nq_x$ sehingga umur 75 tahun. Sebagai contoh, nisbah a daripada data yang diberi akan dikira sebagai:

$$a = \frac{5q_{x+5}}{5q_x}$$

³ A. Coale and P. Demeny (1966)

di mana:

${}_{5}q_{x+5}$ Nilai tertinggi bagi set yang telah diberi yang mana x adalah kurang daripada 70

a Pemalar

Oleh itu, anggaran untuk ${}_{5}q_{x+10}$ ialah:

$${}_{5}q_{x+10} = a \cdot {}_{5}q_{x+5}$$

Hubungan ini digunakan untuk membuat anggaran sehingga ${}_{5}q_{75}$.

3.9 Kadar mortaliti umur tertentu, ${}_nM_x$ bagi penduduk dikira seperti berikut:

$${}_nM_x = \frac{{}_{n}D_x}{{}_{n}P_x}$$

di mana:

${}_{n}D_x$ Bilangan kematian di antara umur x dan $x + n$

${}_{n}P_x$ Bilangan penduduk di antara umur x dan $x + n$

3.10 Sistem *Brass Logit* berasaskan pada transformasi dua parameter jadual hayat standard dan membenarkan variasi infiniti dalam corak kematian pada tahap tertentu. Satu model hubungan telah digunakan untuk membandingkan tahap dan corak kematian antara jadual hayat tiga tahun dan jadual hayat satu tahun yang telah digunakan sebagai standard. Ini adalah berasaskan kepada andaian bahawa jadual kematian yang berbeza boleh dihubungkan secara linear dengan satu sama lain melalui nilai ketakatan masing-masing ke dalam logit, iaitu bilangan orang yang masih hidup pada umur x ditukarkan kepada logit untuk kedua-dua jadual hayat berasaskan satu tahun dan tiga tahun. Ini berdasarkan kepada hubungan berikut:

$$\text{Logit } Y = \alpha + \beta \text{ logit } S$$

Logit Y Merujuk kepada logit bagi nilai I_x daripada jadual hayat dengan kematian purata tiga tahun

Logit S Merujuk kepada logit bagi nilai I_x daripada jadual hayat dengan kematian satu tahun

α Merujuk kepada tahap mortaliti

β Merujuk kepada corak mortaliti

4. PENGIRAAN FUNGSI JADUAL HAYAT

4.1 Jika nilai ${}_nM_x$ digunakan sebagai input, nilai ${}_nq_x$ dihitung sebagai:

$${}_nq_x = \frac{(n \cdot {}_nM_x)}{(1 + (n - {}_nK_x) \cdot {}_nM_x)}$$

di mana:

${}_nq_x$ Kebarangkalian mati di antara umur tepat x dan umur tepat $x + n$

${}_nM_x$ Kadar mortaliti umur tertentu untuk umur x dan $x + n$

n Selang kumpulan umur (1, 4 dan 5)

${}_nK_x$ Faktor pemisah kematian untuk umur x dan $x + n$

Faktor-faktor pemisah kematian untuk umur bawah 1 tahun dan 1-4 tahun boleh disediakan sebagai input atau faktor-faktor pemisah kematian *Coale-Demeny* digunakan.

Faktor pemisah untuk semua kumpulan umur yang lebih tinggi diandaikan sebagai 2.5.

4.2 Penakat (bilangan orang yang masih hidup) pada setiap umur tepat x , l_x ialah:

$$\frac{l_{x+n}}{l_x} = 1 - {}_nq_x \quad \text{dengan radiks } 100,000 \text{ kelahiran, iaitu, pada}$$

umur tepat 0, l_0

4.3 Bilangan kematian di antara umur tepat umur x dan $x + n$, ${}_nD_x$ ialah:

$${}_nD_x = l_x - l_{x+n}$$

4.4 Bilangan orang yang akan hidup-tahun di antara umur tepat x dan $x + n$, ${}_nL_x$ dikira sebagai:

$${}_1L_0 = {}_1k_0 \cdot l_0 + (1 - ({}_1k_0))l_1$$

$${}_4L_1 = {}_4k_1 \cdot l_1 + (4 - ({}_4k_1))l_5$$

$${}_5L_x = 2.5(l_x + l_{x+5}) \quad x = 5, 10, \dots 75$$

di mana:

${}_1k_0$ Faktor pemisah kematian untuk umur bawah 1 tahun

$$\text{Lelaki} : {}_1k_0 = 0.0425 + 2.875 {}_1q_0$$

$$\text{Perempuan} : {}_1k_0 = 0.05 + 3.0 {}_1q_0$$

${}_4k_1$ Faktor pemisah kematian untuk umur 1-4 tahun

$$\text{Lelaki} : {}_4k_1 = 1.653 - 3.013 {}_1q_0$$

$$\text{Perempuan} : {}_4k_1 = 1.524 - 1.625 {}_1q_0$$

Semua faktor pemisah kematian yang digunakan adalah yang telah dicadangkan dalam jadual hayat model *Coale-Demeny*.

Bagi kumpulan umur selang terbuka, L_{80+} dikira sebagai:

$$L_{80+} = 3.725 (l_{80}) + 0.0000625 (l_{80})^2$$

4.5 Kadar tengah mortaliti di antara umur x dan umur $x + n$, ${}_n m_x$ ialah:

$${}_n m_x = \frac{{}_n d_x}{{}_n L_x}$$

4.6 Jumlah bilangan orang yang akan hidup-tahun selepas umur tepat x , T_x ialah:

$$T_x = \sum_{y=x}^{y=w} L_y$$

di mana:

$$\sum_{y=x}^{y=w} L_y \quad \begin{array}{l} \text{Jumlah semua } L_y \text{ untuk umur } x \text{ dan ke atas hingga ke} \\ \text{akhir jadual hayat} \end{array}$$

w Umur tertua di dalam jadual hayat

4.7 Nisbah ketakatan, ${}_n S_x$ ialah:

$${}_n S_x = \frac{{}_n L_{x+5}}{{}_n L_x}$$

di mana:

Perkadaran hidup daripada kelahiran hingga umur 0-4 tahun:

$$S_0 = \frac{{}_5L_0}{5(l_0)}$$

Perkadaran hidup daripada umur 0-4 tahun hingga 5-9 tahun:

$$S_1 = \frac{{}_5L_5}{{}_5L_0}$$

Perkadaran hidup daripada umur x hingga $x + 5$:

$${}_5S_x = \frac{{}_5L_{x+5}}{{}_5L_x}$$

Perkadaran hidup daripada umur 75-80 tahun dan ke atas:

$$S_{75+} = \frac{L_{80+}}{L_{75+}}$$

4.8 Jangkaan hayat pada umur x , e_x ialah:

$$e_x = \frac{T_x}{l_x}$$

5. DEFINISI JADUAL HAYAT

x dan $x + n$ Masa hidup di antara dua umur tepat x dan $x + n$.

Contohnya, umur ‘65-70’ bermaksud 5 tahun selang umur di antara ulang tahun hari lahir ke-65 dan ke-70.

${}_nq_x$

Kebarangkalian mati di antara umur x dan umur $x + n$, iaitu, perkadaran orang dalam kohort yang hidup pada permulaan selang umur yang dinyatakan x yang akan mati sebelum mencapai ke akhir selang umur $x + n$.

Contohnya merujuk kepada Jadual 2.1, kebarangkalian seorang lelaki pada umur tepat 65 tahun akan mati sebelum mencapai ulang tahun hari lahir ke 70, ${}_5q_{65}$ ialah 0.12394, iaitu, daripada setiap 100,000 orang yang hidup dan pada umur tepat 65 tahun, 12,394 akan mati sebelum mencapai ulang tahun hari lahir ke-70.

l_x	Orang yang masih hidup pada setiap umur tepat x , iaitu bilangan orang yang masih hidup pada permulaan selang umur x daripada jumlah kelahiran yang diandaikan seramai 100,000 orang.
	Contohnya merujuk kepada Jadual 2.1, daripada 100,000 bayi lelaki yang baru lahir, 74,950 orang akan hidup sehingga umur tepat 65 tahun.
$n d_x$	Bilangan kematian di antara umur tepat x dan umur tepat $x+n$ iaitu bilangan orang yang akan mati dalam selang umur x hingga $x+n$ daripada jumlah bilangan kelahiran yang diandaikan dalam jadual.

1. INTRODUCTION

- 1.1 A life table is a useful tool for presenting the mortality situation of a population. A life table is prepared from age-specific mortality rates or probability of deaths (q_x) and the results used to measure mortality, survival ratio and life expectancy.
- 1.2 Life expectancy is the average number of years a person is expected to live at the beginning of a certain age, assuming the mortality rate of a certain age is the same throughout his or her lifetime. Life expectancy at birth reflects mortality. It is independent of the population's age structure and is not influenced by extraneous factors such as the selection of a standard population, changes in birth rates and other demographic phenomena.
- 1.3 Life tables are used by demographers, public health workers and actuaries in the studies of fertility, mortality, migration, longevity, population growth, population projections, length of working life and length of married life¹.
- 1.4 This report also provides life tables by major ethnic group at Malaysia level based on the classification used during Population and Housing Census of Malaysia 2020 (MyCensus 2020). The classifications used are:

Citizen

- a. Bumiputera consists of Malay and Other Bumiputera
- b. Chinese
- c. Indians
- d. Others

Non-citizen

- 1.5 The statistics of life expectancy for 2020 to 2022 have been revised based on the MyCensus 2020 meanwhile the statistics of life expectancy for 2010 to 2019 are based on the Population and Housing Census of Malaysia 2010 (Census 2010) and will be revised later.

2. CONCEPTS

- 2.1 Abridged life table is a table that shows the probability that a person at a certain age (5-year age interval) will die before reaching his or her next birthday. A life table is prepared from age-specific mortality rates or probability of deaths (q_x) and the results used to measure mortality, survival ratio and life expectancy.
- 2.2 Life expectancy is the average remaining age (years) for a person is expected to live at the beginning of a certain age if the age-specific death rates of the given period continued throughout his or her lifetime.
- 2.3 Survivors are the number of survivors at the beginning of a certain age.

3. METHODOLOGY

- 3.1 The life tables are generated from Coale-Demeny (West) model based on the average final number of mid-year for three year. This approach was adopted to minimise random annual fluctuations in the number of vital events. The use of triennial deaths implies that there will always be a time lag of one or two years for life tables of a year to be made available. Thus, to cater for the needs of the user, the Brass Logit model was used to generate the estimate of life tables.
- 3.2 The abridged life tables 2020 (final) are generated using the Coale-Demeny (West) model based on the average final number of mid-year deaths by single age, ethnic group, sex and state for 2019, 2020 and 2021.
 - 3.2.1 Mid-year data on deaths for 2019 refers to the deaths recorded in the second half-yearly of 2018 from July to December 2018 and the first half-yearly of 2019 deaths from January to June 2019 by single age, ethnic group, sex and state.
 - 3.2.2 Mid-year data on deaths for 2020 refers to the deaths recorded in the second half-yearly of 2019 from July to December 2019 and the first half-yearly of 2020 deaths from January to June 2020 by single age, ethnic group, sex and state.
 - 3.2.3 Mid-year data on deaths for 2021 refers to the deaths recorded in the second half-yearly of 2020 from July to December 2020 and the first half-yearly of 2021 deaths from January to June 2021 by single age, ethnic group, sex and state.

- 3.2.4 *The input of the population used to generate the abridged life tables is the mid-year population estimates for 2020 based on the MyCensus 2020 by single age, ethnic group, sex and state.*
- 3.3 *The abridged life tables 2021 (preliminary) are generated using the Coale-Demeny (West) model based on the average final number of mid-year deaths by single age, ethnic group, sex and state for 2020, 2021 and 2022 (estimates).*
- 3.3.1 *Mid-year data on deaths for 2020 refers to the deaths recorded in the second half-yearly of 2019 from July to December 2019 and the first half-yearly of 2020 deaths from January to June 2020 by single age, ethnic group, sex and state.*
 - 3.3.2 *Mid-year data on deaths for 2021 refers to the deaths recorded in the second half-yearly of 2020 from July to December 2020 and the first half-yearly of 2021 deaths from January to June 2021 by single age, ethnic group, sex and state.*
 - 3.3.3 *Mid-year death estimates for 2022 refer to the deaths recorded in the second half-yearly of 2021 from July to December 2021 and the first half-yearly of 2022 deaths from January to June 2022 by single age, ethnic group, sex and state. The 2022 estimate deaths based on 10-year death time series data using the time series modeler-exponential smoothing models.*
 - 3.3.4 *The input of the population used to generate the abridged life tables is the mid-year population estimates for 2021 based on the MyCensus 2020 by single age, ethnic group, sex and state.*
- 3.4 *The abridged life tables 2022 (estimates) are generated using the Brass Logit model based on the mid-year death estimates and mid-year population estimates for the current year.*
- 3.4.1 *Mid-year death estimates for 2022 refer to the deaths recorded in the second half-yearly of 2021 from July to December 2021 and the first half-yearly of 2022 deaths from January to June 2022 by single age, ethnic group, sex and state.*
 - 3.4.2 *The input of the population used to generate the abridged life tables is the mid-year population estimates for 2022 based on the MyCensus 2020 by single age, ethnic group, sex and state.*
- 3.5 *The calculation of life tables requires a set of input values of either the age-specific mortality rates of the population, ${}_nM_x$ or the ${}_nq_x$ values, that is, probabilities of dying between exact ages x and $x + n$, where n equals to 5-*

year age intervals except for the first two age groups below 1 year and 1-4 years.

- 3.6 For estimating ${}_1q_0$ and ${}_4q_1$ from ${}_1M_0$ and ${}_4M_1$ and ${}_1L_0$ (where ${}_1L_0$ refers to the number of person-years lived between age 0 and 1) and ${}_4L_1$ from ${}_1q_0$ and ${}_4q_1$, death separation factors which are required from the Coale-Demeny model life tables².
- 3.7 The data input is in the form of 17 values of $_nM_x$ or $_nq_x$. If there are more than 17 values, only data up to ${}_5q_{75}$ were taken. If there are less than 17 values, that is, data up to an age group below the age of 75 years, extrapolation up to the age of 75 years is done automatically.
- 3.8 The extrapolation is done by assuming that the ${}_5q_x$ values have exponential functions. The ratio of the two highest values of ${}_nq_x$ in the data input is constant for estimation, up to the age of 75 years. For example, the ratio of a from the data given is computed as:

$$a = \frac{{}_5q_{x+5}}{{}_5q_x}$$

where:

${}_5q_{x+5}$ The highest value of the given set in which x is less than 70

a Constant value

Therefore, the estimate of ${}_5q_{x+10}$ is:

$${}_5q_{x+10} = a \cdot {}_5q_{x+5}$$

This relationship is used in estimation up to ${}_5q_{75}$.

- 3.9 The age-specific mortality rates, $_nM_x$ of the population calculated as follows:

$${}_nM_x = \frac{nD_x}{nP_x}$$

² A. Coale and P. Demeny (1966)

where:

nD_x Number of deaths between ages x and $x + n$

nP_x Number of populations between ages x and $x + n$

3.10 The Brass Logit system is based on a two-parameter transformation of a standard life table and allows infinite variations in the patterns of mortality at any given level. A relationship model was used to compare the levels and patterns of mortality between triennial year life table and single year life table which was used as a standard. It assumes that different mortality schedules can be linearly related to each other by a transformation of their respective survivorship values into logits, that is, the number of survivors at age x are converted to logits for both the single year-based life table and triennial year-based life table. This is based on the following relationship:

$$\text{Logit } Y = \alpha + \beta \text{ logit } S$$

Logit Y Refers to the logit transformation of l_x values from the life table of triennial average deaths

Logit S Refers to the logit transformation of l_x values from the life table of single year deaths

α Refers to the level of mortality

β Refers to the pattern of mortality

4. COMPUTATION OF LIFE TABLE FUNCTIONS

4.1 If nM_x values are used as inputs, the nq_x values are computed as:

$$nq_x = \frac{(n \cdot nM_x)}{(1 + (n - n)k_x) \cdot nM_x}$$

where:

nq_x Probability of dying between exact age x and exact age $x + n$

nM_x Age-specific mortality rates for ages x and $x + n$

n Age group interval (1, 4 and 5)

${}_n k_x$ Death separation factor for ages x and $x + n$

The death separation factors for ages below 1 year and 1-4 years can be provided as the input or the Coale-Demeny death separation factors can be used.

The separation factor for all higher age groups is assumed to be 2.5.

4.2 Survivors (the number of survivors) at each exact age x , l_x is:

$$\frac{l_{x+n}}{l_x} = 1 - {}_n q_x \quad \text{with a radix of 100,000 births, that is, at exact age 0, } l_0$$

4.3 The number of deaths between exact ages x and $x + n$, ${}_n d_x$ is:

$${}_n d_x = l_x - l_{x+n}$$

4.4 The number of person-years lived (survivors) between exact ages x and $x + n$, ${}_n L_x$ is calculated as:

$${}_1 L_0 = {}_1 k_0 \cdot l_0 + (1 - ({}_1 k_0))l_1$$

$${}_4 L_1 = {}_4 k_1 \cdot l_1 + (4 - ({}_4 k_1))l_5$$

$${}_5 L_x = 2.5(l_x + l_{x+5}) \quad x = 5, 10, \dots 75$$

where:

${}_1 k_0$ Death separation factors for ages below 1 year

$$\text{Male} : {}_1 k_0 = 0.0425 + 2.875 {}_1 q_0$$

$$\text{Female} : {}_1 k_0 = 0.05 + 3.0 {}_1 q_0$$

${}_4 k_1$ Death separation factors for aged 1-4 years

$$\text{Male} : {}_4 k_1 = 1.653 - 3.013 {}_1 q_0$$

$$\text{Female} : {}_4 k_1 = 1.524 - 1.625 {}_1 q_0$$

All the death separation factors used are as suggested in Coale-Demeny model life tables.

The open-ended age group, L_{80+} is calculated as:

$$L_{80+} = 3.725 (l_{80}) + 0.0000625 (l_{80})^2$$

4.5 The central mortality rate between age x and age $x + n$, ${}_n m_x$ is:

$${}_n m_x = \frac{{}_n d_x}{{}_n L_x}$$

4.6 The total number of person-years lived after exact age x , T_x is:

$$T_x = \sum_{y=x}^{y=w} L_y$$

where:

$$\sum_{y=x}^{y=w} L_y \quad \text{Sum of the } L_x \text{ for ages } x \text{ and over to the end of the life table}$$

$$w \quad \text{The oldest age in the life table}$$

4.7 The survival ratio, ${}_n S_x$ is:

$${}_n S_x = \frac{{}_n L_{x+5}}{{}_n L_x}$$

where:

Proportion of surviving from birth to ages 0-4 years is:

$$S_0 = \frac{{}_5 L_0}{5(l_0)}$$

Proportion of surviving from ages 0-4 years to 5-9 years is:

$$S_1 = \frac{{}_5 L_5}{{}_5 L_0}$$

Proportion of surviving from ages x to $x + 5$ is:

$${}_5 S_x = \frac{{}_5 L_{x+5}}{{}_5 L_x}$$

Proportion of surviving from ages 75-80 years and over is:

$$S_{75+} = \frac{L_{80+}}{L_{75+}}$$

4.8 Life expectancy at the age x , e_x is:

$$e_x = \frac{T_x}{l_x}$$

5. LIFE TABLE DEFINITIONS

x and $x + n$ The period of life between two exact ages x and $x + n$.

For example, age group of the age of '65-70' means the 5-year interval between the 65th and 70th birthdays.

${}_nq_x$ The probability of dying between age x and age $x + n$, the proportion of persons in the cohort that alive at the beginning of age interval x who will die before reaching the end of that age interval $x + n$.

For example, refer to the Table 2.1, the probability that a person of exact the age of 65th will die before reaching his 70th birthday, ${}_5q_{65}$ is 0.12394, that is, out of every 100,000 persons alive and exactly 65 years old, 12,394 will die before reaching their 70th birthday.

l_x Survivors at each exact age x , that is, the number of persons living at the beginning of an age interval x out of a total of births assumed to be 100,000 persons.

For example, refer to the Table 2.1, out of 100,000 newborn male babies, 74,950 persons would survive to exact the age of 65th years.

${}_n d_x$ The number of deaths between exact age x and exact age $x + n$, that is, the number of persons who would die within the indicated age interval x to $x + n$ out of the total number of births assumed in the table.

For example, refer to the Table 2.1 there would be 9,289 deaths for male between exact the ages of 65 years and 70 years to the initial cohort of 100,000 newborn male babies.

${}_n m_x$ Central mortality rate between exact age x and exact age $x + n$.

For example, refer to the Table 2.1, the central mortality rate for male between the age of 65 years and the age of 70 years is 9,289 / 351,526 that is, 0.02643.

nL_x The number of person-years lived (survivors) between exact age x and exact age $x+n$ by the cohort 100,000 births assumed.

For example, refer to the Table 2.1, the 100,000 newborn male babies would live 351,526 person-years between exact the ages of 65 years and 70 years. Out of 74,950 person who reach the age of 65 years, the 65,661 persons who survive to the age of 70 years would live 5 years each, that is, 328,305 person-years ($65,661 \times 5 = 328,305$ person-years) and 9,289 persons who die would each live varying periods of time less than 5 years, averaging about 2.5 years, that is, 23,222 person-years ($9,289 \times 2.5 = 23,222$).

nS_x The proportion of survivors from age group x to $x+n$ to another age group $x+5$ to $x+5+n$.

For example, refer to the Table 2.1 the proportion of survivors for male from the age group of 65-69 to the age group of 70-74 is $297,867 / 351,526$ that is 0.84735.

T_x The total number of person-years to be lived after the beginning of exact age x by the cohort of 100,000 births assumed.

For example, refer to the Table 2.1, the 100,000 of newborn male babies would live 1,106,836 person-years after their 65th birthday.

e_x Life expectancy is the average remaining age (years) for a person is expected to live (survives) at the beginning of a certain age x if the age-specific death rates of the given period continued throughout his/ her lifetime.

For example, refer to the Table 2.1, males who reaches his 65th birthday is expected to live 14.8 years more.
